Preface	vi
1 Introduction	1
1.1 Aims	1
1.2 Outline	2
1.3 Motivating Examples	4
1.4 The Bayesian Paradigm	14
Exercises	15
2 Markov Chain Monte Carlo Sampling	19
2.1 Gibbs Sampler	20
2.2 Metropolis–Hastings Algorithm	23
2.3 Hit-and-Run Algorithm	26
2.4 Multiple-Try Metropolis Algorithm	30
2.5 Grouping, Collapsing, and Reparameterizations	31
2.5.1 Grouped and Collapsed Gibbs	31
2.5.2 Reparameterizations: Hierarchical Centering and Rescaling	34
2.5.3 Collapsing and Reparameterization for Ordinal Response Models	35
2.5.4 Hierarchical Centering for Poisson Random Effects Models	40
2.6 Acceleration Algorithms for MCMC Sampling	42

2.6.1	Grouped Move and Multigrid Monte Carlo Sampling	43
2.6.2	Covariance-Adjusted MCMC Algorithm	45
2.6.3	An Illustration	47
2.7	Dynamic Weighting Algorithm	52
2.8	Toward “Black-Box” Sampling	55
2.9	Convergence Diagnostics	59
	Exercises	63
3	Basic Monte Carlo Methods for Estimating Posterior Quantities	67
3.1	Posterior Quantities	67
3.2	Basic Monte Carlo Methods	68
3.3	Simulation Standard Error Estimation	71
3.3.1	Time Series Approach	71
3.3.2	Overlapping Batch Statistics	73
3.4	Improving Monte Carlo Estimates	77
3.4.1	Variance-Reduction MCMC Sampling	77
3.4.2	Weighted Monte Carlo Estimates	81
3.5	Controlling Simulation Errors	86
	Appendix	89
	Exercises	89
4	Estimating Marginal Posterior Densities	94
4.1	Marginal Posterior Densities	95
4.2	Kernel Methods	97
4.3	IWMDE Methods	98
4.4	Illustrative Examples	104
4.5	Performance Study Using the Kullback–Leibler Divergence	107
	Appendix	117
	Exercises	121
5	Estimating Ratios of Normalizing Constants	124
5.1	Introduction	124
5.2	Importance Sampling	125
5.2.1	Importance Sampling–Version 1	126
5.2.2	Importance Sampling–Version 2	126
5.3	Bridge Sampling	127
5.4	Path Sampling	129
5.4.1	Univariate Path Sampling	130
5.4.2	Multivariate Path Sampling	131
5.4.3	Connection Between Path Sampling and Bridge Sampling	132
5.5	Ratio Importance Sampling	132
5.5.1	The Method	132

5.5.2	Implementation	135
5.6	A Theoretical Illustration	138
5.7	Computing Simulation Standard Errors	143
5.8	Extensions to Densities with Different Dimensions	145
5.8.1	Why Different Dimensions?	145
5.8.2	General Formulation	146
5.8.3	Extensions of the Previous Monte Carlo Methods	147
5.8.4	Global Optimal Estimators	149
5.8.5	Implementation Issues	152
5.9	Estimation of Normalizing Constants After Transformation	160
5.10	Other Methods	161
5.10.1	Marginal Likelihood Approach	162
5.10.2	Reverse Logistic Regression	163
5.10.3	The Savage–Dickey Density Ratio	164
5.11	An Application of Weighted Monte Carlo Estimators	165
5.12	Discussion	172
	Appendix	173
	Exercises	187
6	Monte Carlo Methods for Constrained Parameter Problems	191
6.1	Constrained Parameter Problems	191
6.2	Posterior Moments and Marginal Posterior Densities	193
6.3	Computing Normalizing Constants for Bayesian Estimation	196
6.4	Applications	199
6.4.1	The Meal, Ready-to-Eat (MRE) Model	199
6.4.2	Job Satisfaction Example	205
6.5	Discussion	208
	Appendix	208
	Exercises	211
7	Computing Bayesian Credible and HPD Intervals	213
7.1	Bayesian Credible and HPD Intervals	214
7.2	Estimating Bayesian Credible Intervals	216
7.3	Estimating Bayesian HPD Intervals	218
7.3.1	An Order Statistics Approach	219
7.3.2	Weighted Monte Carlo Estimation of HPD Intervals	220
7.4	Extension to the Constrained Parameter Problems	221
7.5	Numerical Illustration	223
7.5.1	A Simulation Study	223
7.5.2	Meal, Ready-to-Eat (MRE) Data Example	224
7.6	Discussion	226
	Appendix	227
	Exercises	232

8	Bayesian Approaches for Comparing Nonnested Models	236
8.1	Marginal Likelihood Approaches	237
8.1.1	The Method	237
8.1.2	Computation	237
8.2	Scale Mixtures of Multivariate Normal Link Models . . .	239
8.2.1	The Models	240
8.2.2	Prior Distributions and Posterior Computations .	242
8.2.3	Model Comparison	245
8.2.4	Item Response Data Example	249
8.3	“Super-Model” or “Sub-Model” Approaches	250
8.4	Criterion-Based Methods	252
8.4.1	The L Measure	253
8.4.2	The Calibration Distribution	256
8.4.3	Breast Cancer Data Example	259
	Exercises	263
9	Bayesian Variable Selection	267
9.1	Variable Selection for Logistic Regression Models	268
9.1.1	Model and Notation	268
9.1.2	The Prior Distributions	269
9.1.3	A Generalization of the Priors	270
9.1.4	Choices of Prior Parameters	272
9.1.5	Prior Distribution on the Model Space	273
9.1.6	Computing Prior and Posterior Model Probabilities	275
9.2	Variable Selection for Time Series Count Data Models .	282
9.2.1	The Likelihood Function	283
9.2.2	Prior Distributions for $\beta^{(m)}$	284
9.2.3	Prior Distribution on the Model Space	286
9.2.4	Sampling from the Posterior Distribution	287
9.2.5	Computation of Posterior Model Probabilities . .	289
9.3	Stochastic Search Variable Selection	293
9.4	Bayesian Model Averaging	297
9.5	Reversible Jump MCMC Algorithm for Variable Selection	300
	Appendix	303
	Exercises	304
10	Other Topics	307
10.1	Bayesian Model Adequacy	307
10.1.1	Predictive Approach	307
10.1.2	Latent Residual Approach	315
10.2	Computing Posterior Modes	320
10.2.1	Lindley–Smith Optimization	320
10.2.2	Stochastic Approximation	323
10.3	Bayesian Computation for Proportional Hazards Models	326
10.3.1	Model	326

10.3.2	Prior Distribution for $h_b(\cdot)$	326
10.3.3	The Likelihood Function	328
10.3.4	Prior Distribution for the Regression Coefficients	329
10.3.5	Sampling from the Posterior Distribution	330
10.4	Posterior Sampling for Mixture of Dirichlet Process Models	334
10.4.1	Conjugate MDP Models	336
10.4.2	Nonconjugate MDP Models	337
10.4.3	MDP in Normal Random Effects Models	338
10.4.4	MDP for Generalized Linear Mixed Models . . .	341
	Exercises	353
	References	356
	Author Index	375
	Subject Index	381
